Camping in nature

- The main goal of this festival is to help students to contact and communicate with nature. So they camp in nature as a group of friends.
- They prepare everything to stay in the day light and enjoy the sky at night.

Observing in day and night

- The most interesting part of the festival is to observe the sky during the day or at night. Students can learn how to use a telescope and try to find objects in the sky by themselves.
- They see the sun in the daylight and many objects at night. They learn how to find constellations in the sky and how to use them to find the directions.

Astronomical handmade

- Each group has a leader who is also an astronomy instructor. He helps them to learn and enjoy the day and also try to make sure that they won't have any problem during the stay.
- One of the activities that they do with their leader is to make some handmade astronomical tools. They learn to use them during the night.
- What they learn the most in this activity is: Team Work!

Finally

- Lots of students are together and enjoy the festival together. It's a time to talk and make new friends.
- Having fun, enjoy the time and learn something incredible. That's the rule!

Thank you for your attention!
